

**Codebook for the replication data of
“Correcting Misperceptions Across Contexts:
The Political Impact of Gender Inequality Information
in Japan and South Korea”**

The replication data files (“Korea_data.csv” and “Japan_data.csv”) include variables that were mentioned in the preregistration document as exploratory measures but were ultimately not used in the paper. These variables are indicated with a dagger (†), and wordings are provided only for them in this document. For variables used in the paper, please refer to the Supplementary Information.

Although referenced in the preregistration, we do not make the following variables publicly available in order to prevent potential breaches of anonymity: browser information (recorded only in the Japanese data); municipality of residence; and open-ended explanations of respondents’ ratings of the trustworthiness of the corrective information on the gender pay gap or income gap. Researchers who wish to access these variables may contact the manager of the replication files.

Q14 and Q15 in the Korean data and Q9 and Q10 in the Japanese data were included for purposes unrelated to the present paper and were therefore not mentioned in the preregistration. These variables are not included in the datasets released for replication. In addition, Q6 did not exist in the original Korean survey.

Unless otherwise specified, the Korean and Japanese datasets share the same questions and variable coding. For such variables, the name before the slash refers to the Korean dataset, and the name after the slash refers to the Japanese dataset. Please note that for some variables the response options are identical but the coding scheme differs across the two datasets.

The Japanese dataset also includes paradata recorded using Qualtrics’ built-in functions. These variables measure the time (in seconds) from when a respondent entered a page to their first click, last click, and page submission, as well as the number of clicks on that page. Variables with names ending in “_First.Click,” “_Last.Click,” “_Page.Submit,” and “_Click.Count” correspond to these measures for the variable immediately preceding them. The exceptions are as follows: Q1.2_... refers to the informed consent page at the beginning of the survey; Q13.2_... refers to the page where the corrective information on the gender pay gap was provided; and Q14.2_... refers to the page where the corrective information on the income gap was provided. These variables are not listed individually below.

Gubun/condition

Experimental condition.

[Korean survey]

- 1: T1 (corrective information provision on the gender pay gap)
- 2: T2 (corrective information provision on the income gap)
- 3: C (no information provision)

[Japanese survey]

- 1: C
- 2: T1
- 3: T2

Q1/Q2_1

Attention check. This variable is constant (3) for all respondents because data from only those who correctly answered this attention check are included in the datasets.

Q2/Q3_1

Year of birth.

[Korean survey]

A value corresponds to a respondent's age.

[Japanese survey]

A value corresponds to a respondent's age minus 16.

Q3_1 (Korean survey)[†]

Region of residence. The original Korean of the response options is omitted below.

귀하가 살고 계신 곳은 어느 지역입니까? (Where do you live?)
